

AURA — Ship & Operate Pack · 8 Blueprint Files for Getting It Into Photographers' Hands

The first 46 files tell Claude Code how to **build** AURA. The Reliability Pack tells it how to build AURA **without bugs**. This pack covers everything between "the code works on my machine" and "a photographer in Pokhara paid for it, installed it, and it culled their wedding at 2 a.m. without you awake".

Why this pack exists

The existing bundle has a blind spot that is common to engineering-led plans: it assumes that a correct application is a shippable product. It is not. Eight things are still missing, and each of them can kill the project **after** the code is finished.

Gap	What happens if you ignore it
No dataset provenance	You train on scraped wedding photos, and one licence claim ends the business
No consent model	A photographer's clients' faces went to a cloud API; under GDPR that is their liability and your lawsuit
No update or rollback path	Version 1.2 corrupts catalogs, and 400 users have no way back to 1.1
No runbooks	Every support ticket is a research project; you become the bottleneck
No first-run design	Users install, see an empty window, and never return — the highest-leverage screen in the product is unspecified

Gap	What happens if you ignore it
No style-learning spec	AURA edits like a generic AI, not like <i>this</i> photographer, and the whole value proposition collapses
No interop path	Nobody abandons a 200,000-image Lightroom catalog to try you
No licensing that works offline	Your offline-first product needs an internet connection to start — the contradiction users will mock you for

Files in this pack

#	File	Answers the question
23	23-DATASET-AND-CORPUS-SPEC.md	Where does every training and test image legally come from?
24	24-PRIVACY-CONSENT-AND-LEGAL.md	Who is allowed to see a bride's face, and who is liable?
25	25-PACKAGING-UPDATE-AND-ROLLBACK.md	How does a fix reach users, and how do we undo a bad one?
26	26-SUPPORT-RUNBOOK-LIBRARY.md	A user reports error AURA-RAW-2008 at midnight — now what?
27	27-ONBOARDING-AND-FIRST-RUN.md	What happens in the first 10 minutes, before any trust exists?
28	28-STYLE-LEARNING-SPEC.md	How does AURA learn to edit like this specific photographer?
29	29-INTEROP-AND-MIGRATION.md	How does someone with a Lightroom catalog switch without fear?
30	30-LICENSING-AND-ACTIVATION.md	How do we get paid without breaking offline-first?

Three operating invariants added by this pack

- **O1 — Provenance or it does not train.** Every image used to train, evaluate or demo has a recorded licence and an identifiable source. No exceptions, no "found on the internet".
- **O2 — The photographer owns the decision to share.** Nothing about their clients leaves their machine unless they specifically, per-project, said yes.

- **O3 — Every version can be undone.** Any release can be rolled back to the previous one without data loss, in under five minutes, by a non-technical user.

How to use this pack

These files are consumed at different moments than the phase specs:

- **23 and 24 before any model phase.** Training on unlicensed data is not a thing you can retroactively fix.
- **27 and 28 before the UI phases.** They define what the UI is for.
- **29 alongside the catalog phases.** Import format decisions are contracts.
- **25, 26 and 30 before the first external beta.** Not before launch — before the first stranger touches it.

 23-DATASET-AND-CORPUS-SPEC.md — Every image has a licence and a name

 24-PRIVACY-CONSENT-AND-LEGAL.md — Whose face is it, and who is liable?

 25-PACKAGING-UPDATE-AND-ROLLBACK.md — Shipping a fix, and undoing a bad one

 26-SUPPORT-RUNBOOK-LIBRARY.md — One page per error code, written before the ticket arrives

 27-ONBOARDING-AND-FIRST-RUN.md — The ten minutes that decide everything

 28-STYLE-LEARNING-SPEC.md — Editing like this photographer, not like an AI

 29-INTEROP-AND-MIGRATION.md — Nobody abandons a 200,000-image Lightroom catalog

 30-LICENSING-AND-ACTIVATION.md — Getting paid without breaking offline-first
